Managing and Accounting for Fixed Assets

William C. Rivenbark

Fixed assets represent a significant investment of public dollars for local governments and public authorities. Items that constitute fixed assets are tangible in nature and normally have a useful life of at least two years. Commonly used classifications of fixed assets are land, buildings, equipment, and vehicles.

Maintaining control of fixed assets is a function of the entire organization, not just the accounting department. To maintain financial control of fixed assets from an accounting perspective, a locality must properly report their value on its annual financial statements. To maintain internal control from a management perspective (that is, to ensure use of the assets for authorized purposes and to prevent their misuse or theft), the locality must assign custodial responsibility for fixed assets to the department and division managers who employ them for service delivery. A fixed assets policy based on the recommended practices of the Government Finance Officers Association (GFOA) and the Local Government Commission (LGC) is essential to obtaining both types of control.

External auditors review fixed assets records and internal controls during the annual audit. They issue an “unqualified audit opinion” if the general-purpose financial statements present fairly, in all material respects, the financial position of the organization. This type of audit opinion is extremely important to staff, managers, council members, investors, and creditors. External auditors issue a “qualified audit opinion” if they find that the financial statements are inadequate in a material respect. Lack of control over fixed assets is one of the primary causes for receiving a qualified audit opinion. For localities that receive a qualified opinion concerning their accounting for fixed assets, the LGC will no longer authorize the issuance of long-term debt (bonds).¹

The purpose of this article is to encourage localities to review their fixed assets policies and to establish capitalization thresholds based on criteria proposed by the GFOA and the LGC. A “capitalization threshold” is the dollar value at which assets are “capitalized” (carried on the general ledger) rather than “expensed” (shown on the general ledger as a decrease in cash and an increase in expenditures). Fixed assets purchased by “governmental funds” (public-purpose funds, such as public safety and public works) are capitalized at their original historical cost and remain at that value throughout their life. Fixed assets purchased by “proprietary funds” (business-like funds, such as public utilities) are capitalized at their original historical cost and depreciated over their useful life. Items of insignificant value are simply expensed in their year of purchase.

Localities tend to capitalize assets at dollar values much lower than needed, setting policy primarily to satisfy the internal control function rather than the financial reporting function.² They should set the dollar value for capitalization of assets with the objective of accurately reporting the value of fixed assets on their annual financial statements. Internal control of fixed assets should be addressed in the fixed assets policy by more effective means than the capitalization threshold.

Legal, Administrative, and GAAP Requirements

The North Carolina General Statutes (hereinafter G.S.) do not address the management of fixed assets in detail, providing flexibility for local governments. G.S. 159-26(a) states that “each local government or public authority shall establish and maintain an accounting system designed to show in detail its assets, liabilities, equities, revenues, and expenditures.” Additionally, G.S. 159-26(b)(8) requires that an accounting system be designed to provide for “a ledger or group of accounts in which to record the details relating to

External auditors move toward a qualified audit opinion when fixed assets records do not materially reflect the value of fixed assets or when proper internal controls are not in place to safeguard the assets.

### Capitalization Threshold

An effective fixed assets policy must be tailored to the individual needs of an organization. Therefore the organization must reconcile the recommendations offered by the GFOA and the LGC with its own demands.

Estimating the useful life of assets. A fixed assets policy should begin by stating its purpose and effective date. It then should define fixed assets. The LGC maintains that “fixed assets are tangible in nature and have a useful life longer than one year. They are classified as land, improvements other than buildings, buildings, operating plants, equipment, and construction in progress.” The GFOA promotes a similar definition but states that “fixed assets should be capitalized only if they have an estimated useful life of at least two years following the date of acquisition.” Normally a locality capitalizes assets with a useful life of at least two years unless special circumstances dictate otherwise.

Determining the threshold. The next step is to establish the capitalization threshold. In practice, land and buildings always are capitalized, so the capitalization threshold primarily applies to equipment and vehicles. The GFOA maintains that “as a general rule, capitalization thresholds should be designed to encompass approximately 80 percent of a government’s total noninfrastructure assets”—that is, assets other than items like roads, bridges, and sidewalks. In addition, the GFOA recommends that a government never use a capitalization threshold of less than $1,000 for any individual item.

The LGC states that “equipment and vehicles costing $500 or more should be recorded as fixed assets.” To rec-
Internal Control Function

Although the capitalization threshold is primarily a financial reporting issue, a locality should address the internal control function during the development of its fixed assets policy. Localities often need to track certain assets regardless of value—weapons purchased by the police department, for example. The LGC suggests that localities faced with this issue assign a value of one dollar to each asset and track it accordingly.13 (Assigning a one-dollar value overcomes the problem that some accounting software packages will not let the user enter assets with a value of zero).

Establishing multiple capitalization thresholds. The GFOA maintains that a government may establish a single capitalization threshold for all of its fixed assets or establish multiple capitalization thresholds for different classes of fixed assets.”14 Localities should consider multiple thresholds to control certain specialty items—for example, data processing equipment. Multiple capitalization thresholds sometimes are appropriate, but localities should be careful not to expand excessively the number of items that they must record as fixed assets.

Assigning custodial responsibility. The fixed assets policy should require department and division managers to establish procedures that address the control not only of fixed assets but of assets that fall below the capitalization threshold. With a threshold of $1,000, for example, most lawn-maintenance equipment, like mowers and shredders, would not be capitalized. However, department and division managers must tag and track these assets. This form of control can be more effective in preventing misuse than a control mechanism located in the accounting area. The organization therefore should assign custodial responsibility to individuals who can immediately detect problems associated with fixed assets. For an additional control measure, the finance department should maintain copies of all assets records.

Conducting periodic inventories. The GFOA recommends conducting periodic inventories of capitalized fixed assets and supports a physical count based on a rotating method to ensure that all fixed assets are accounted for at least once every five years.15 The LGC recommends annual verification of the existence and the condition of all fixed assets.16 The LGC recommendation is more realistic for adequate control but should be expanded to include certain assets that may fall below the capitalization threshold. For example, periodically, localities should physically verify the existence of weapons, computer equipment, and lawn-maintenance equipment that are not capitalized.

Reporting of a Change in the Capitalization Threshold

When a locality increases its capitalization threshold, it must delete from the fixed assets list the items that fall below the new dollar value. It also must adjust the notes to its financial statements17 (see Table 1 for an illustration of how to show this change for general fixed assets).18

Reporting the actual dollar amount of the new capitalization threshold is

optional. The purpose of the adjustments column is to avoid overstating the disposal of fixed assets and to let the reader know that a change has been made. In Table 1 the $1.5 million value decrease resulting from an increase in the capitalization threshold is relatively small compared with the overall total of approximately $26.6 million. The major impact of the change is the number of items that have been removed from the fixed assets list.

New Requirements for Recording Infrastructure and Depreciating Capital Assets

The Governmental Accounting Standards Board’s recent passage of Statement No. 34 has heightened the importance of accurate fixed assets records. The new pronouncement requires the recording and the tracking of infrastructure along with customary fixed assets. Further, because of its inclusion of infrastructure, the board has substituted the term “capital assets” for “fixed assets.” The capitalization threshold will not be a major issue in determining whether to record infrastructure or not. Like land and buildings, infrastructure is almost always recorded as a capital asset. The issue is with a new depreciation requirement for governmental funds. After the implementation of Statement No. 34, capital assets, including equipment and vehicles, will have to be depreciated. This requirement will force external auditors to intensify their examination of capital assets records (because capital assets records will contain more auditable information than fixed assets records do). That in turn will place additional importance on establishing a manageable capitalization threshold.

Conclusion

The capitalization threshold and the internal control function are extremely important to a meaningful and manageable fixed assets policy. Localities also should address other areas when constructing a fixed assets policy, including the use of only capital accounts to purchase fixed assets and the offering of annual training in the management of fixed assets. Often overlooked, annual training is an excellent way to expose employees regularly to the idea that managing assets is a function of the entire organization, not just the accounting department.

Local governments tend to capitalize assets at overly low dollar values. When seen only in the context of control, this practice is explainable. Capitalization thresholds, however, are a function of financial reporting. The guidance presented by the GFOA and the LGC offers a logical approach for establishing a meaningful and manageable capitalization threshold. Based on the need for materially accurate financial statements, the guidelines are designed to reduce the possibility of a qualified opinion stemming from lack of control of fixed assets. Local government and public authority administrators, as well as council members, should be proactive in constructing a comprehensive fixed assets policy. Accountability, credit quality, and time are at stake.

Notes

2. GOVERNMENT FINANCE OFFICERS ASSOCIATION, RECOMMENDED PRACTICES FOR STATE AND LOCAL GOVERNMENTS (Chicago: GFOA, 1999).
3. Principle 5 requires a clear distinction between general fixed assets and fund fixed assets. Principle 6 requires the recording of all fixed assets at their historical cost or at their estimated historical cost if their actual cost cannot be determined. Principle 7 addresses the depreciation of fixed assets, requiring that depreciation be recorded in proprietary funds and certain trust funds. Depreciation is not recorded in governmental funds, but accumulated depreciation may be recorded in the General Fixed Assets Account Group (GFAAG), although few governments currently choose this option.
